

The Transformation Journey

By **Martin H. Olsen**, CEO of Sitemule

A smarter path to modernizing your ERP — without the risk of a big-bang migration.

Modernize IBM i Without Starting Over

What if transformation did not require replacing your ERP, rewriting business logic, or risking daily operations? This is a controlled path from legacy complexity to a modern, integrated IBM i platform.

The Real Risk Is Not IBM i

The biggest risk is **losing knowledge**, disrupting proven workflows, and replacing systems that already run the business.

- ❏ Sitemule starts by preserving what works — then modernizing around it.

STEP 1

Recover the Knowledge

Sitemule Blueprint reveals dependencies, business rules, application flows, and hidden system logic.

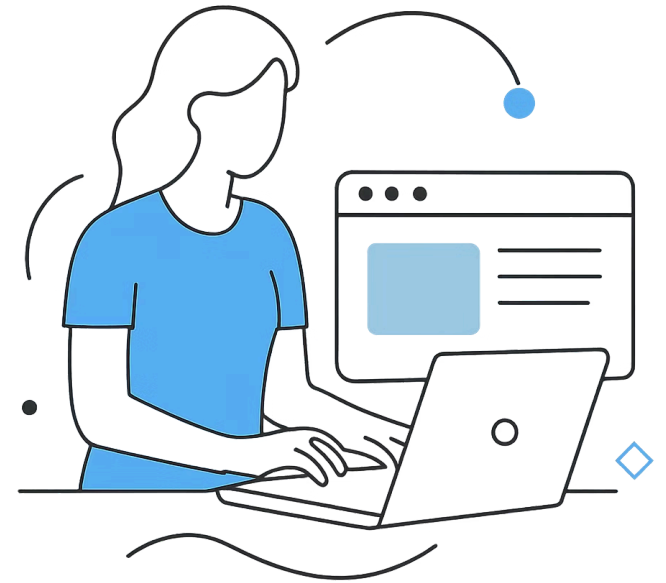

Undocumented legacy systems become visible, searchable, and understandable.

STEP 2

Move the Experience to the Web

Sitemule Platform brings the 5250 environment into the browser from day one.

- Tabs, windows, and modern search
- Modern access and integration
- No changes to existing programs

STEP 3

Improve the User Experience

Sitemule Workspace transforms 5250 screens into smarter, more intuitive web interfaces — delivered in weeks.

- Better navigation and validation
- Multilingual support and workflows
- Modern integrations

STEP 4

Build Around Business Domains

Grids & Forms

Turn existing Db2 structures into modern domain-driven interfaces.

Workflows & Reports

Deliver structured business processes and reporting with ease.

Reuse Logic

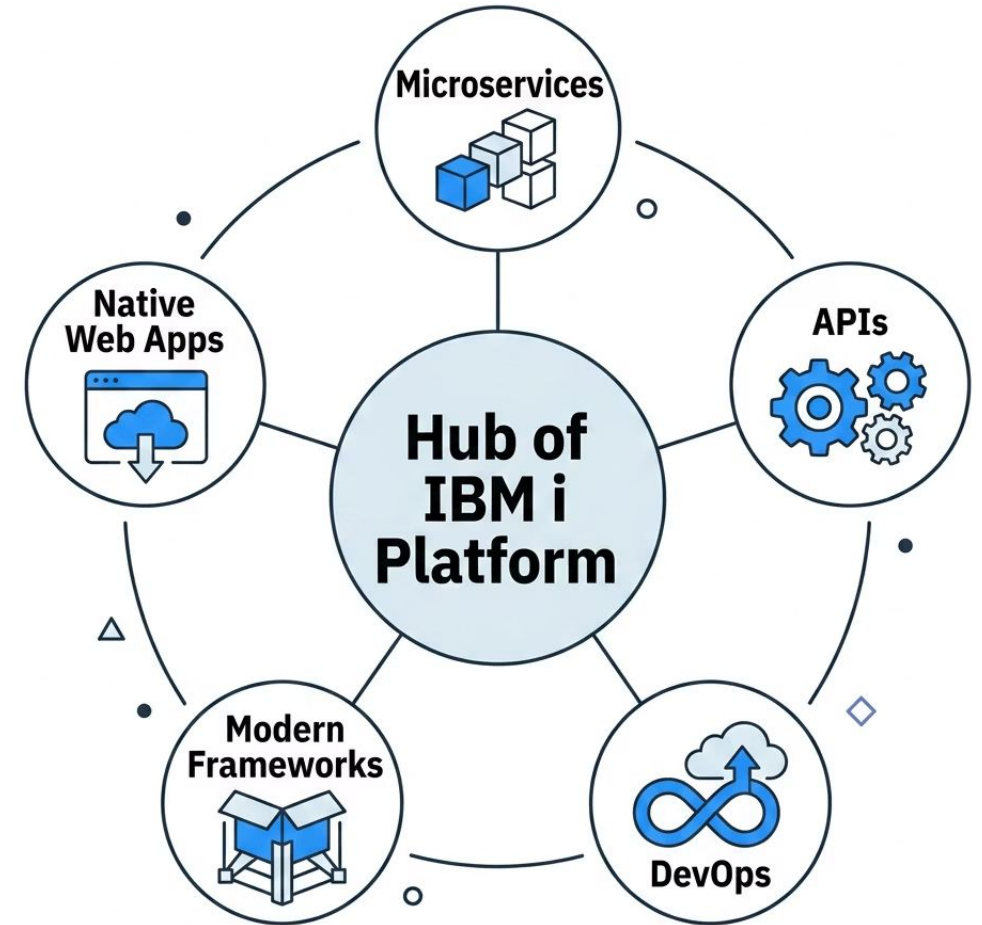

Sitemule Architect preserves and reuses existing business logic throughout.

STEP 5

Think in Services, Not Systems

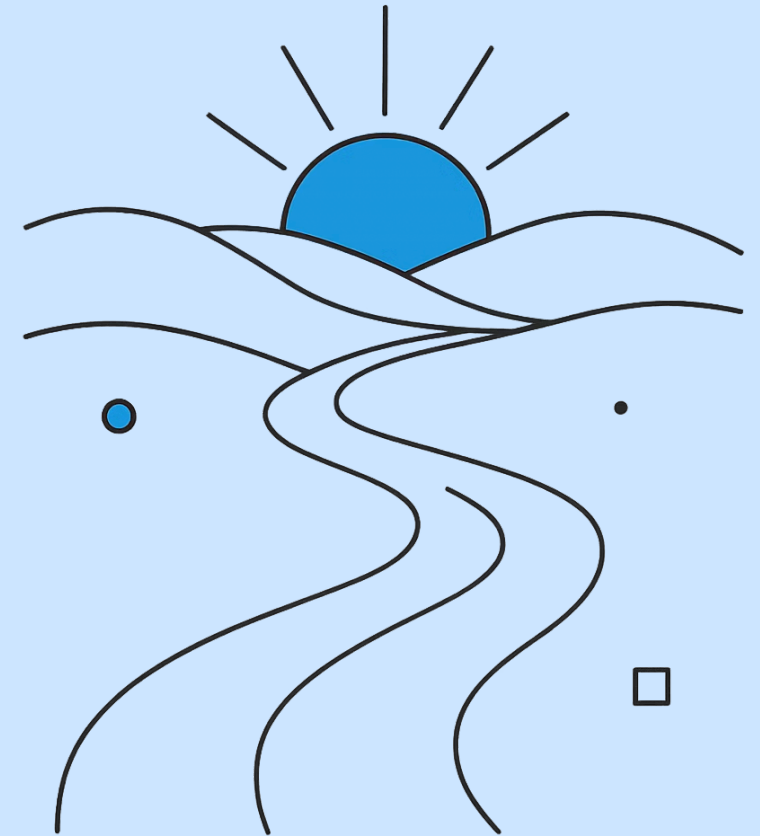

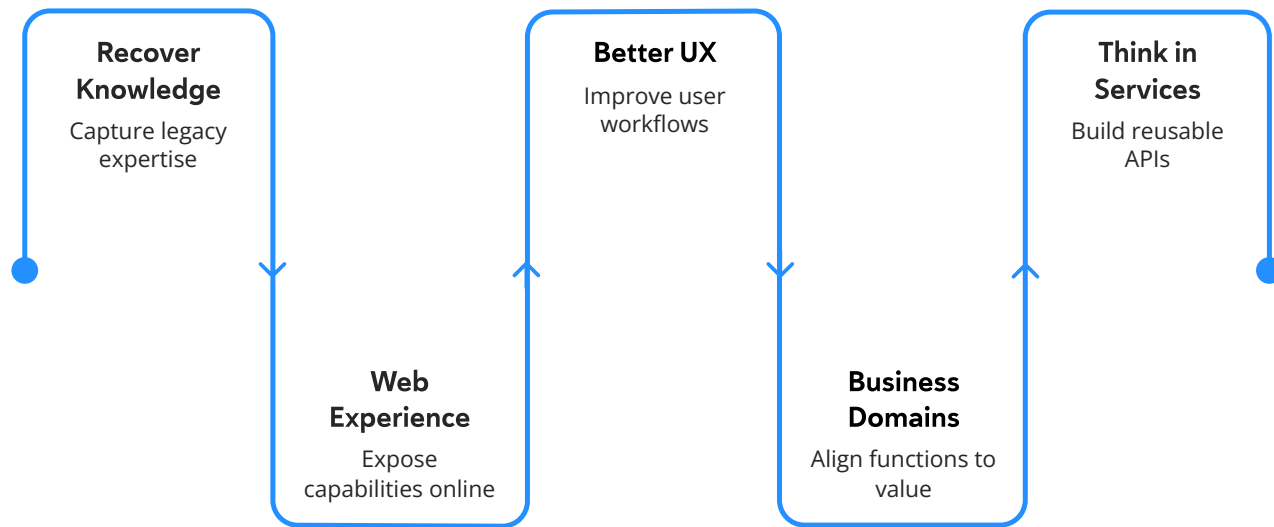

Sitemule Enterprise enables microservices, APIs, DevOps, modern frameworks, and native IBM i web applications.

IBM i becomes a **secure, scalable platform** for continuous innovation.

The Transformation Journey

This is not a risky big-bang migration. It is a **step-by-step journey** that protects business continuity, delivers visible results early, and turns IBM i into a foundation for the future.
